

PILL

Stop the Start of Opioid Addiction

PILL, a smart opioid dispenser, provides patients, physicians and pharmacists with a low cost tool to address the prescription opioid crisis while simultaneously improving patient outcomes, decreasing costs to health insurers and industry providers.

PILL, issued by the pharmacist, contains the prescribed medication in the appropriate dosage in a low cost, tamper evident plastic container. The re-useable, ultra-low power E-ink screen displays prescription information, dosage time, QR codes, etc.

Integrated PDMP data capture is at the heart of how PILL revolutionizes the blending of patient-centric benefits with an unprecedented level of behavioral data collection. This extends prescriber intent to the patient's point of use which provides all stakeholders with a clear picture of prescription use at a micro and macro level.

PILL

Stop the Start
of Opioid Addiction

FREQUENCY

- At pharmacy
- Periodic
- Real Time

FEATURES

- Adherence Monitoring / Efficacy
- Real Time Frequency Modification
